Overview

China Petroleum Engineering Co., Ltd. (CPE) is a subsidiary of China National Petroleum Corp. (CNPC). CPE provides integrated solution for Oil and Gas field development. And CPE is the Technical Support Centre of CNPC Oil & Gas Field Surface Facilities.

90% Development Plan, PreFEED & FEED
For CNPC Overseas Oil & Gas Field Surface Facilities Projects

50% PreFEED, FEED
For CNPC Overseas Oil & Gas Pipeline and Storage Projects

60+ YEARS IN OIL & GAS	**1200+** TOTAL	**28** COUNTRIES
20+ YEARS OVERSEAS	**300+** DUBAI OFFICE	**100+** OIL & GAS FIELDS

> An Existing Oil Field presently producing for an Onshore production facility

> Project Intent is to increase crude oil production from the current production rate of 1.1 Million Barrels Oil per Day (MMBOPD) to 1.5 MMBOPD.

> This increase in production will be achieved by developing different fields.

- Project consist of total 10 remote stations with 5 of RS are having dewatering & remaining 5 without dewatering
- Well connected to RD by flow line & RS connected to CDS via various trunkline of sizes 16" to 20" length of trunkline 30-28 km
- CDS is main processing station consisting seven production trains

- RS- REMOTE STATIONS
- DW – DEWATERING, NDW – NON DEWATERING
- CDS – CENTRAL DEGASSING STATION

PROCESS CHALLENGE

Long start up time before the operation reaches normal operating conditions.

Avoid oversizing of equipment such as slug catchers.

SOLUTION

SLUGGING OF PIPELINE

➢ Study of Slugging (Hydrodynamic and pigging) behavior of multi-phase fluid in pipeline with production separators to optimize the hold up volume considering drain rate.

➢ Fix the trip set points of processing equipment to avoid frequent trips of plant

中国石油集团工程设计有限责任公司

➢ Scenarios during Detailed Engineering Phase

- Emergency Scenarios: Equipment and Instrumentation design check in front of trips, blocked lines, changes in production
- Control Philosophy: Control loops, alarms settings

➢ Start-Up Operations

- Facilities Start-Up, wells management
- Early Production Simulation
- Transition to Normal Production

➢ Daily Operations and Maintenance

- Analysis for future production rates

Could the Operating Procedures being improved and fully test ?

Are equipment protected?

Onshore Plant

Will the Safety System perform well?

Can we improve the plant's production, reducing flare and improve controllability?

Is the design suitable for all potential transients?

中国石油集团工程设计有限责任公司
CHINA PETROLEUM ENGINEERING CO., LTD
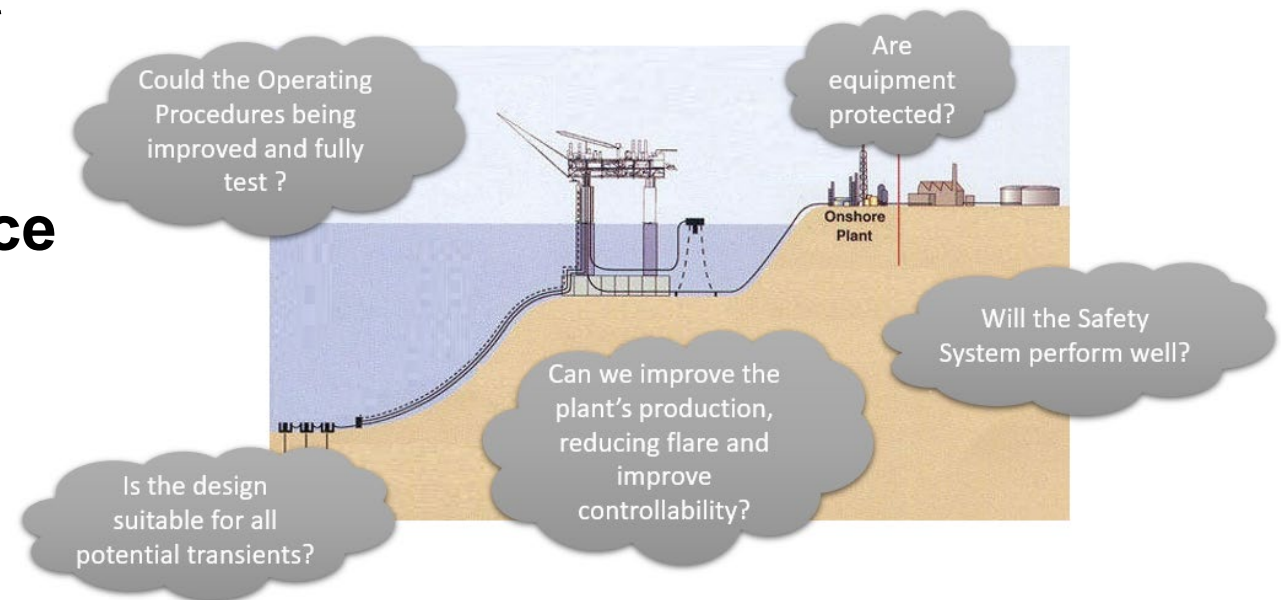

Save in expensive equipment and materials

Leverage the modelling effort by training plant operators

Avoid lengthy and costly plant start-up

Skip unexpected trips and equipment damage during start-up

Reduce time-to-market and total project schedule

Test operating procedures candidates

Revalidate existing safety equipment

**Check and select adequate alternatives in a risk-free environment**

中国石油集团工程设计有限责任公司
CHINA PETROLEUM ENGINEERING CO., LTD
➢ Pipelines Transient Simulation Model (with OLGA®)

➢ Processing Plant Dynamic Model (with Aspen HYSYS Dynamics)

➢ Integrated Pipeline-Topside Model (through Aspen HYSYS-OLGA link)

Aspen HYSYS

中国石油集团工程设计有限责任公司
CHINA PETROLEUM ENGINEERING CO., LTD
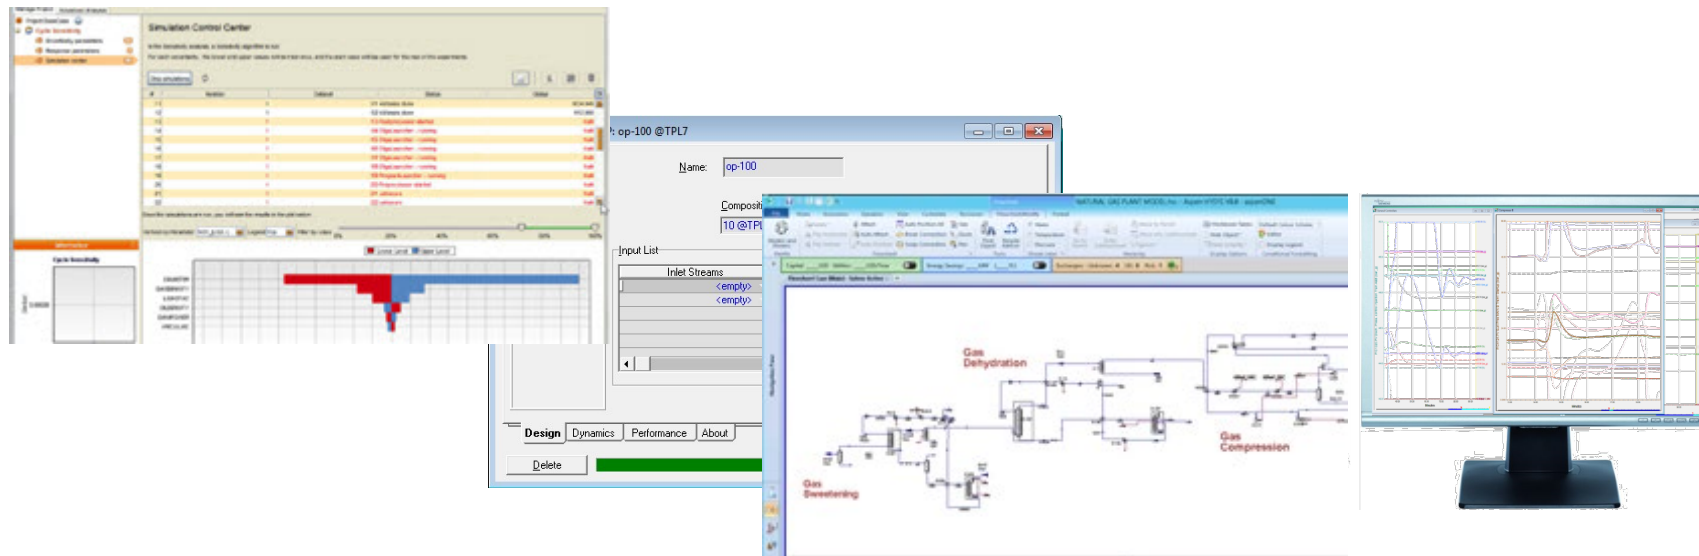

➢ Aspen HYSYS Dynamic Process simulator

- *Powerful thermodynamic engine* for property calculation and three phase equilibrium
- **Very suitable for process equipment** such as rotatory machines, Distillation columns and heat exchangers
- **Pressure balance solver in dynamic Simulation**
- Flexibility to **implement complex control logic**
- **Industrial Standard tool** for Dynamic Process simulation

➢ OLGA® Dynamic Multiphase Flow Simulator

- Helps predict multiphase transient behaviour in pipelines from wells to topside process facilities.
- Flexibility to implement long travel distances with complicated pipeline geometries
- It simulates key pipeline operational procedures like start-up, shut-down, and pigging
- Allows prediction of slug dynamics in liquid dominated systems

NOTE: Aspen HYSYS Upstream ™ also includes pipeline hydraulic sub-flowsheet for dynamic multiphase flow simulation.

中国石油集团工程设计有限责任公司

Oil flow
Gas flow
Water flow

Flow

OLGA® Link

Temp

Aspen HYSYS Model
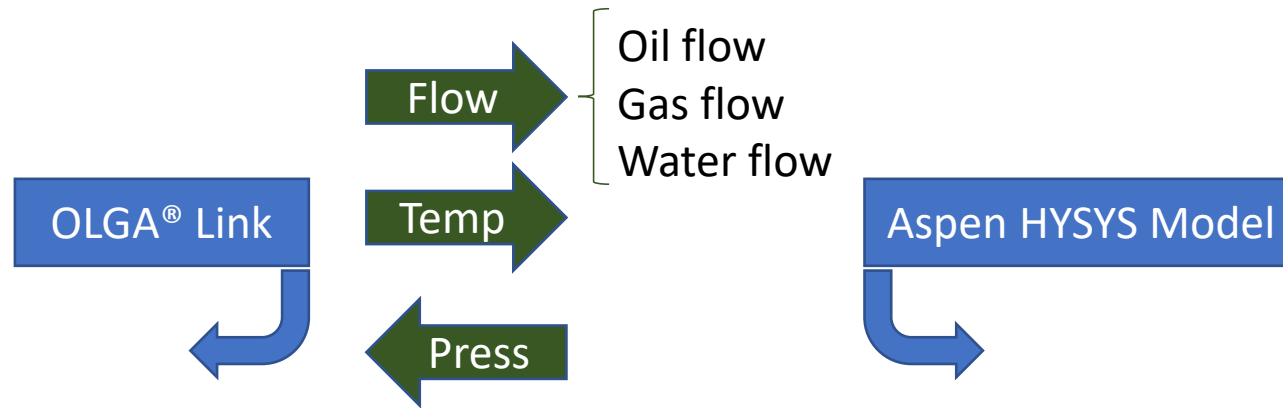

Press

▷ Long pipelines

- Terrain profile properly modeled
- Temperature and pressure drop known more accurately
- Slugs profile obtained
- No compositional calculation is used to accelerate the calculations

▷ Process site

- Compositional model is used
- Thermodynamic and flash at each main process equipment is considered
- Complex equipment is modeled
- Control strategy behavior is modelled and known

The integration between Aspen HYSYS and OLGA® Link provides the advantage of both of them to analyze the interactivity between multiphase pipeline and process for the key operational procedures of the Asset

Objectives

➢ **Ensure trips are avoided during the start-up**
➢ **After ESD some liquid remains in the piping. During start-up this leads to a surge of liquid to downstream separators**
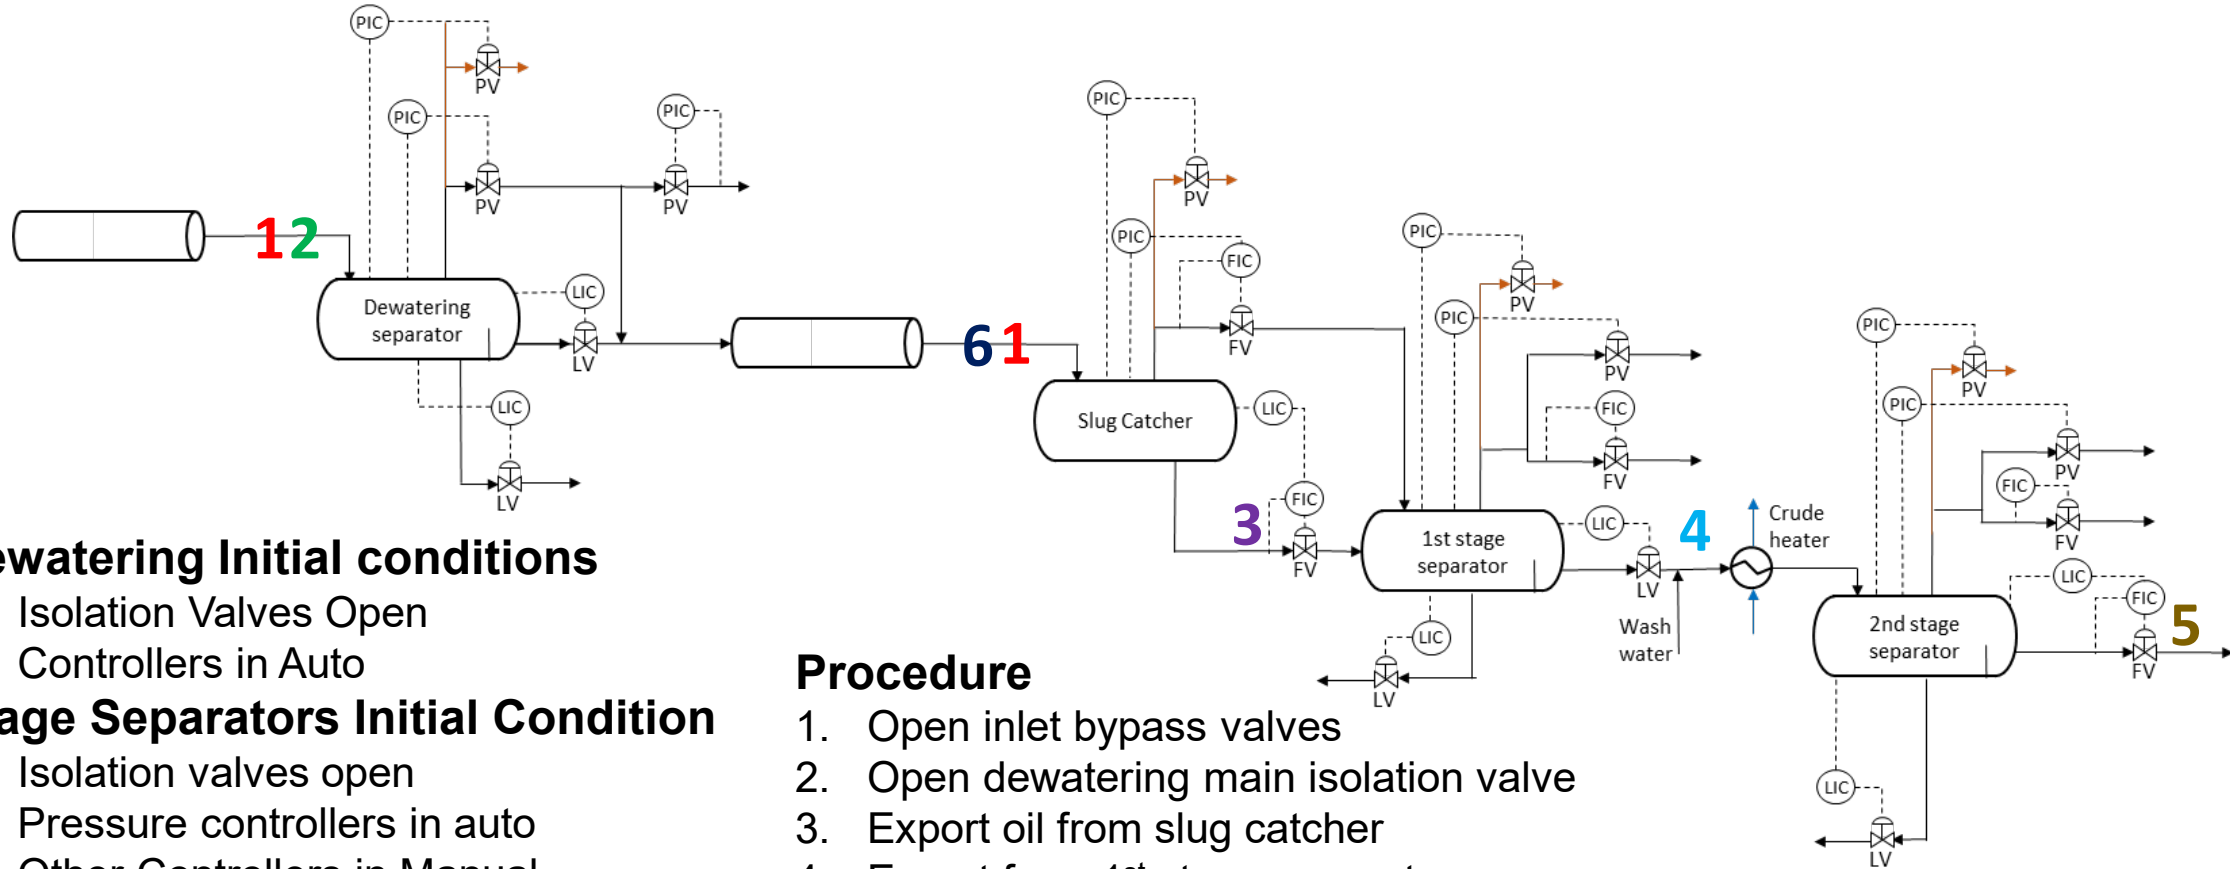

Dewatering Initial conditions

✓ Isolation Valves Open
✓ Controllers in Auto

Stage Separators Initial Condition

✓ Isolation valves open
✓ Pressure controllers in auto
✓ Other Controllers in Manual

Procedure

1. Open inlet bypass valves
2. Open dewatering main isolation valve
3. Export oil from slug catcher
4. Export from 1st stage separator
5. Export from 2nd stage separator
6. Open full feed

*ESD- Emergency shut down

inprocess

© Inprocess

中国石油集团工程设计有限责任公司
CHINA PETROLEUM ENGINEERING CO., LTD
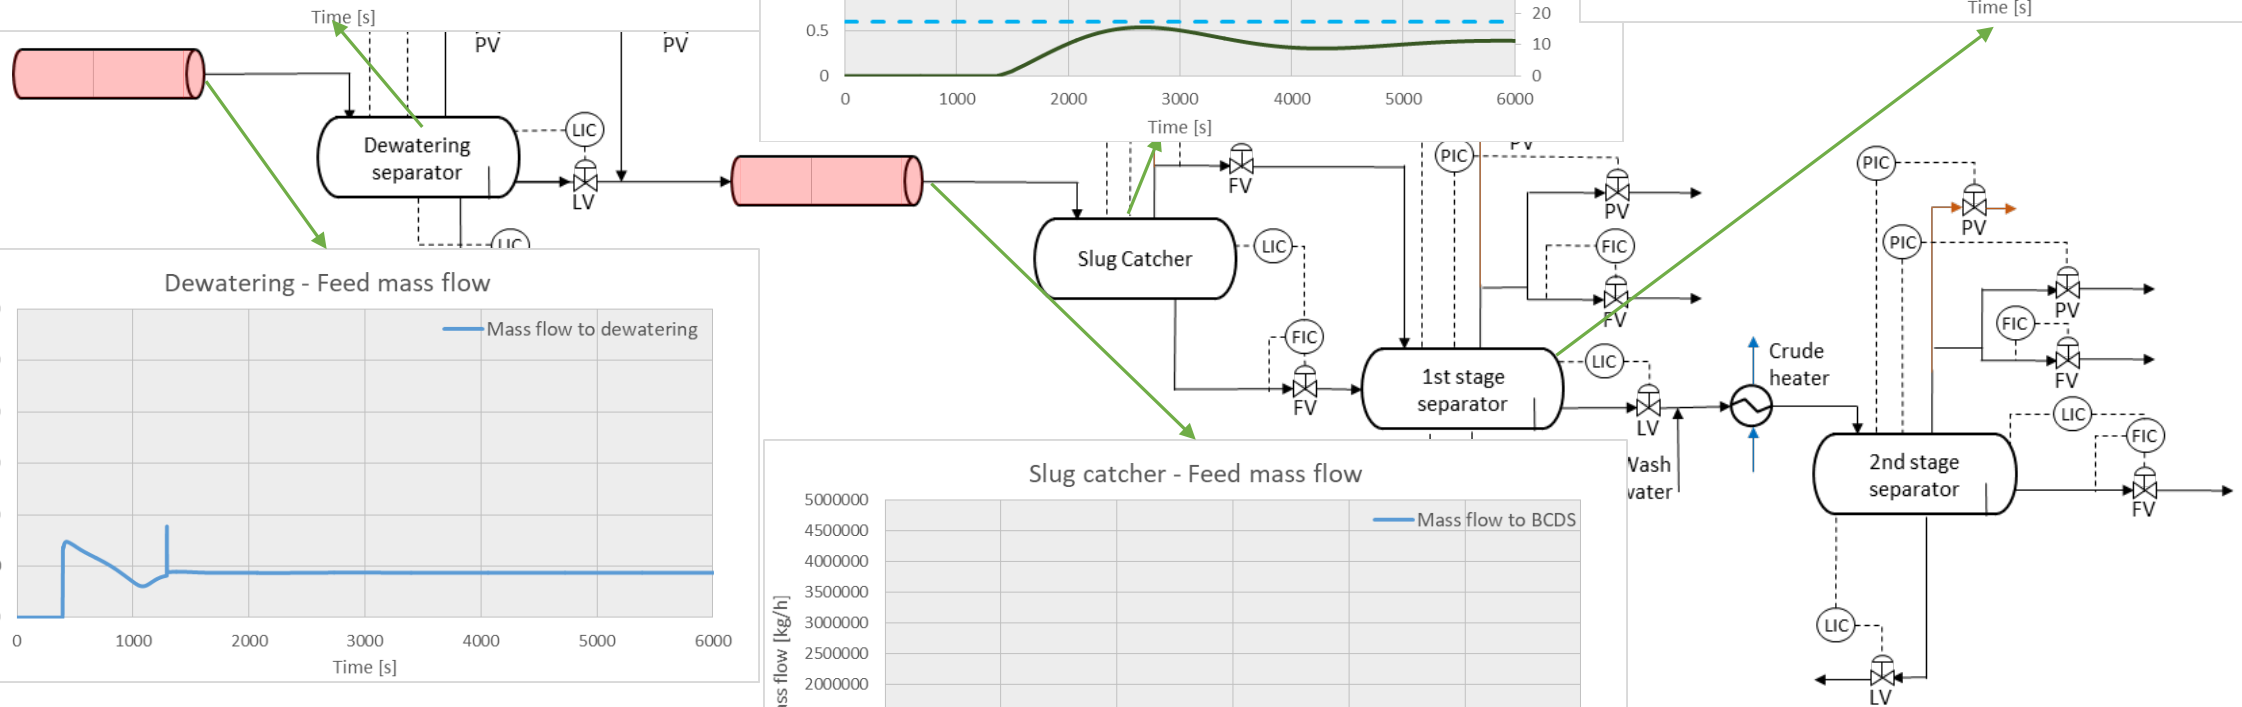

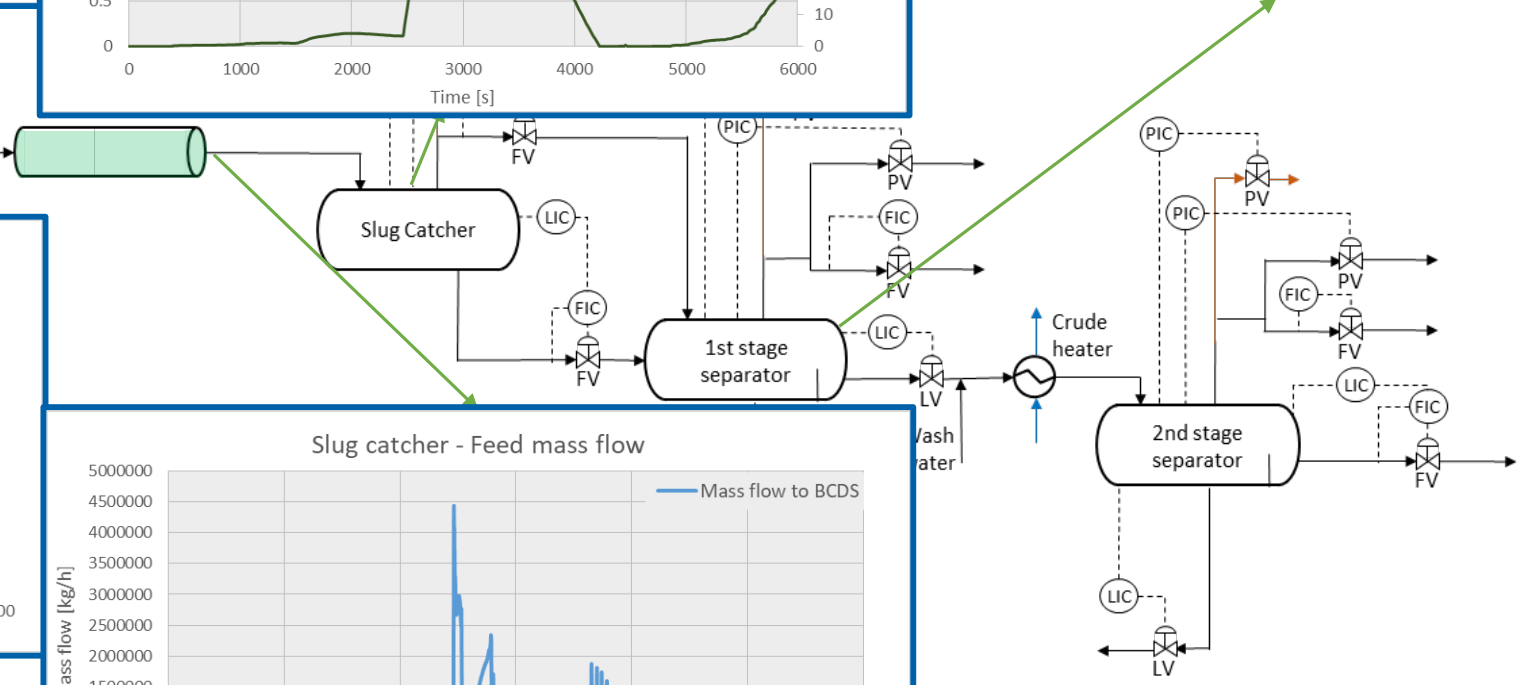

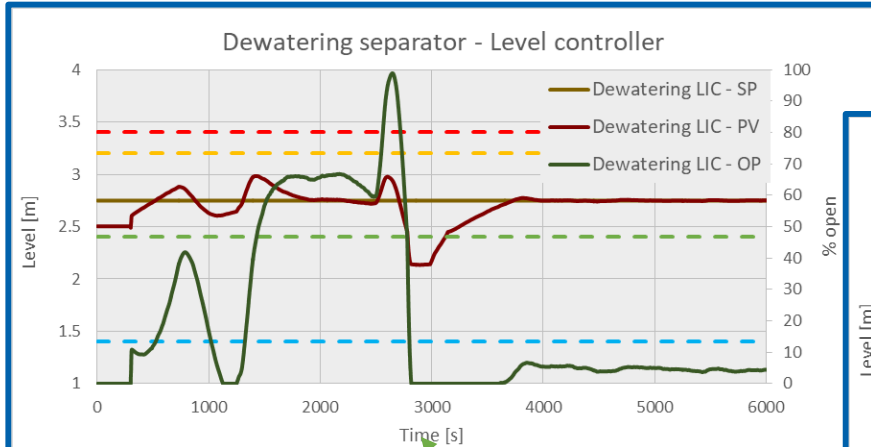

General conclusions

✓ Avoided trips in the facilities during start-up

✓ Dewatering section is able to start-up in automatic mode

Aspen HYSYS-OLGA® LINK benefits for start-up

✓ Optimized the start-up procedure, reduces the start-up time by around 40%. For a typical black start-up
  - A net saving of 4 days can be achieved for steady state operation
  - Considering around 100,000 bbl/day of production & oil price of $50/bbl, results in savings of $20MM

✓ A surge to liquid reaches the facilities
  - Stage separators surge of liquid is quite high.
  - Controllers needed to be more aggressive than proved during startup without link. Slugging behavior at dewatering station is observed. It is proved that facilities are able to handle the fluctuations produced.

中国石油集团工程设计有限责任公司

➢ **Benefits and Future Improvements of using the Aspen HYSYS-OLGA® Link**
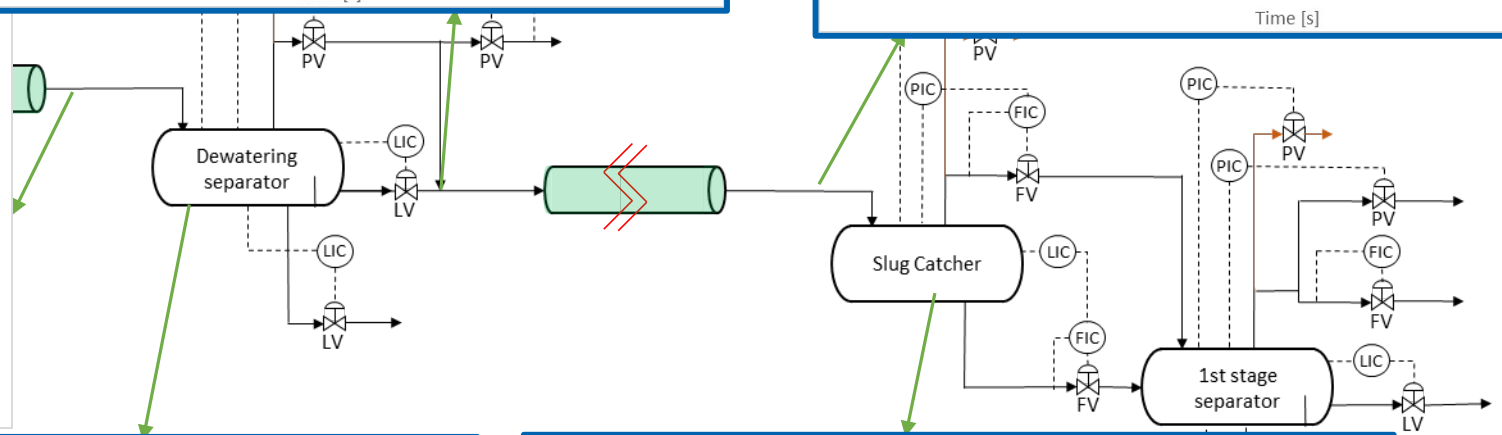

Objectives

➢ **To ensure any trip is avoided in the facilities**
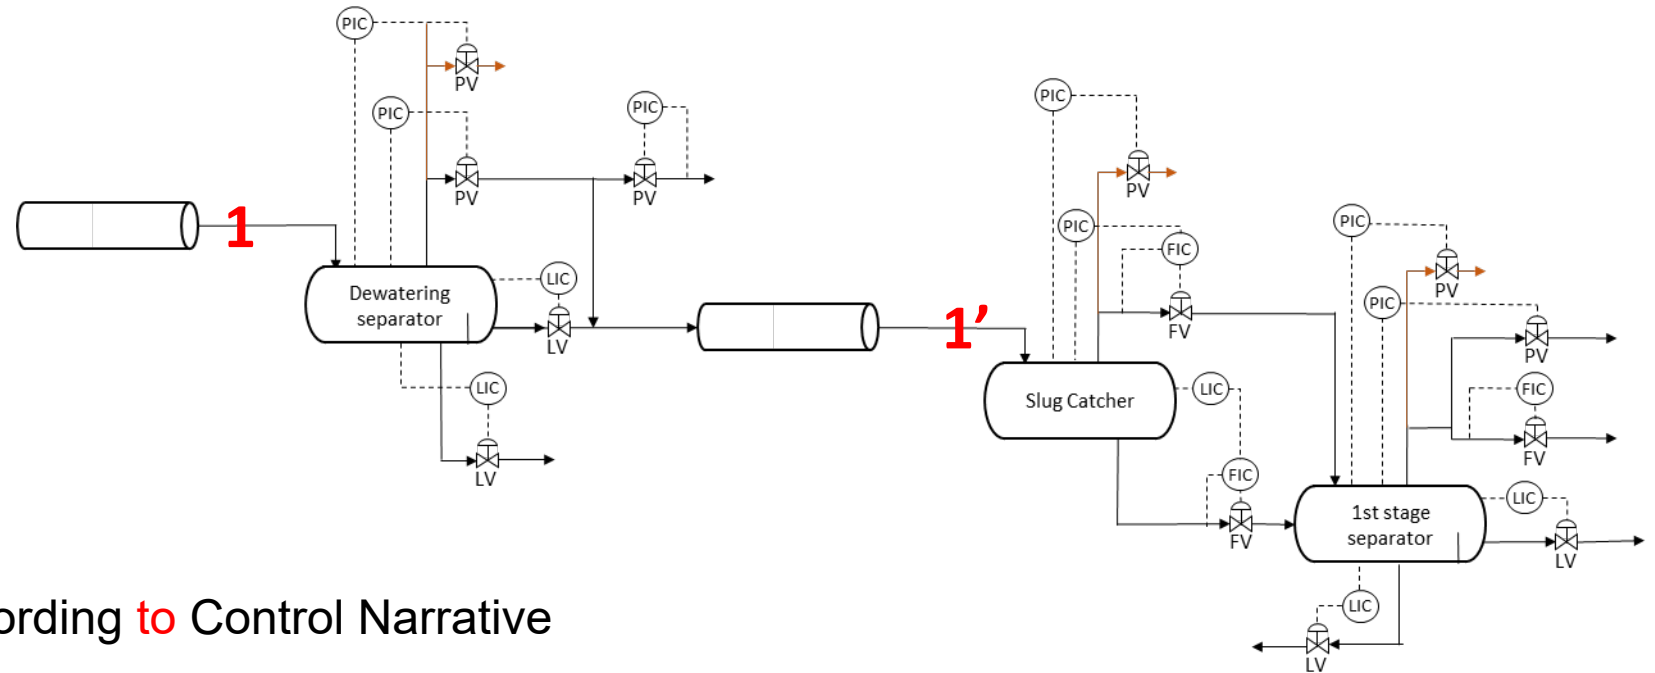

Procedure

1. Ramp down flow according to Control Narrative

中国石油集团工程设计有限责任公司
CHINA PETROLEUM ENGINEERING CO., LTD
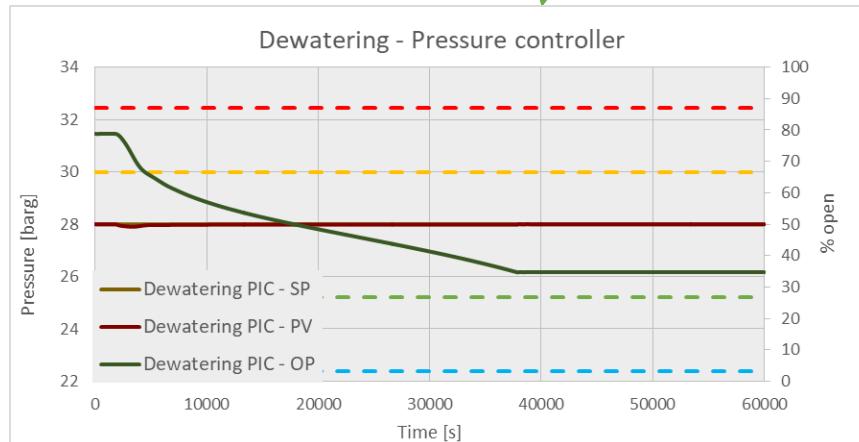

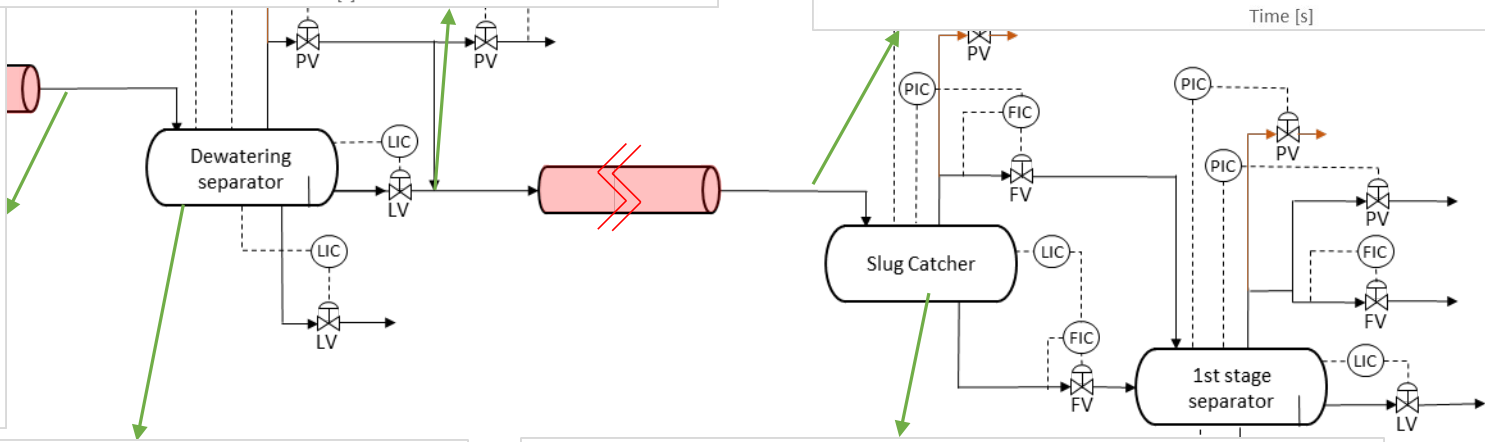

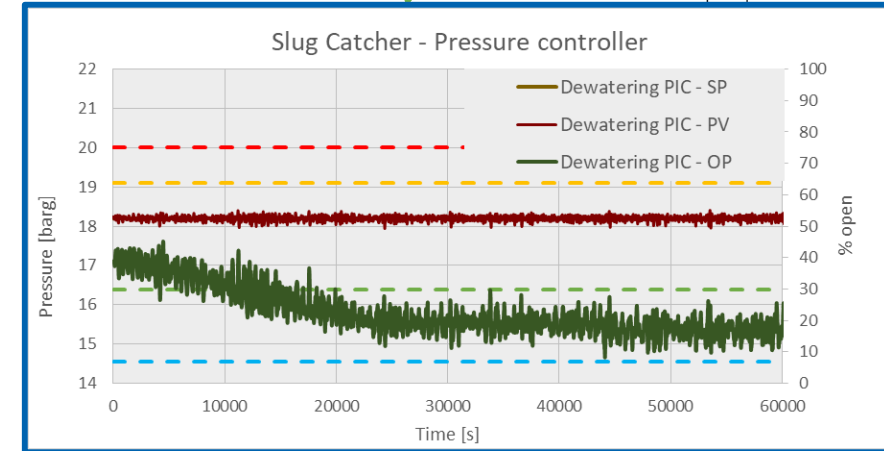

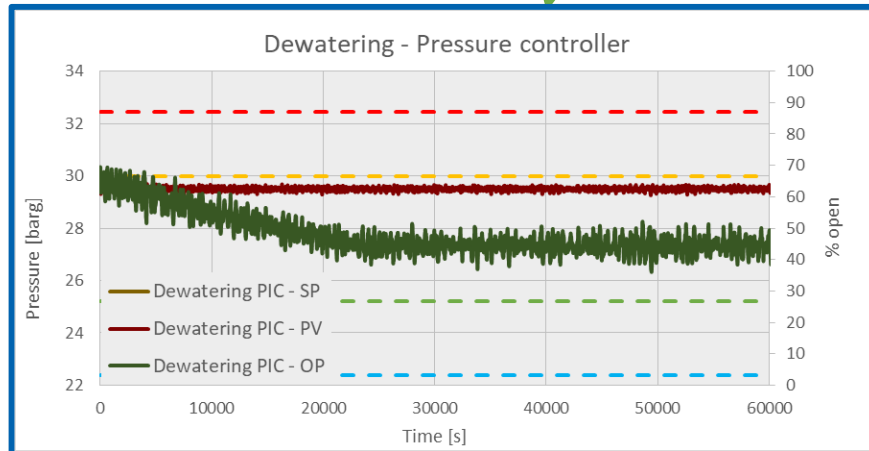

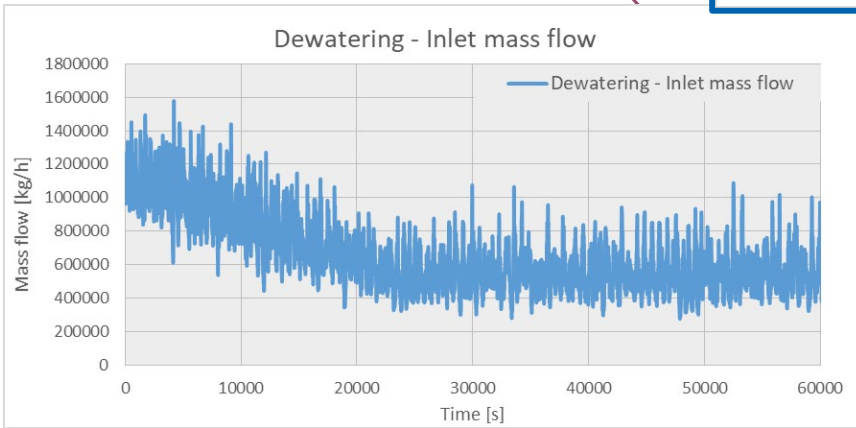

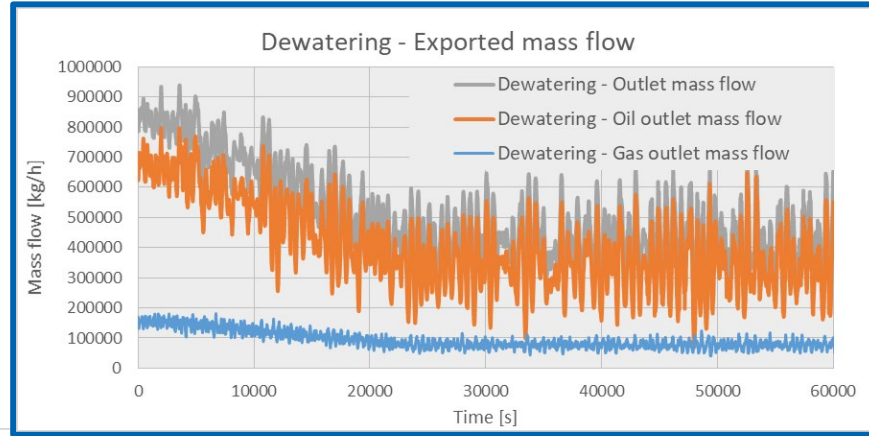

General conclusions

✓ No trip is reached during the ramp down scenario

✓ Stage separators sections are able to handle the slug behavior

Aspen HYSYS-OLGA® LINK benefits for Ramp-down

✓ Scenario with the Linked model against data feed model is compared for stage separators

- Higher flowrate peaks than expected are found
- Lower pressure peaks are found

✓ Avoiding a trip could save 2 days of production loss, 50,000 bbl/day at $50/bbl would be around $ 5MM savings

✓ Dewatering separators are able to handle the fluctuations produced with the link

中国石油集团工程设计有限责任公司
CHINA PETROLEUM ENGINEERING CO., LTD

➢ **WITHOUT LINK**

➢ **Aspen HYSYS Dynamics WITH OLGA® LINK**

- No major issue was found during the performance of the scenarios mentioned above

  Facilities are able to **handle the fluctuations** produced by the **slugging** behavior

- Startup after ESD was performed with a smooth transition and no significant impact

  A surge of liquid reaches the facilities resulting in a peak of level **that needed some fast actions** by the level controllers

- Safety valves are properly sized

  Some chattering is observed in the safety valves and measures to avoid them are taken

- Ramp down is performed with no major issue. Slugging in Stage Separator causes no trip alarm

  No issue is found either. **Slugging flow is higher than predicted** without link while pressure spikes are lower.

NOTE: Aspen HYSYS Upstream ™ also includes pipeline hydraulic sub-flowsheet for dynamic multiphase flow simulation.

中国石油集团工程设计有限责任公司
CHINA PETROLEUM ENGINEERING CO., LTD

➤ **Benefits of Using Aspen HYSYS Dynamics -OLGA® Link**

- Improve fidelity of dynamic process model boundaries

- Optimise plant inlet arrangement to maximize production

- It allows the analysis of the impact of piping scenarios over facilities such as pigging operations or wells start up

- It provides the capability of understanding how the controllers impact over the pipelines facilities

- It gives feedback on whether the facilities are able to handle the slugging behavior

- Optimised the start-up procedure, reduces the start-up time by around 40%. For a typical black start-up

  - A net saving of 4 days can be achieved for steady state operation

  - Considering around 100,000 bbl/day of production & oil price of $50/bbl, results in savings of $20MM

- Avoiding a trip could save 2 days of production loss, 50,000 bbl/day at $50/bbl would be around $ 5MM savings

- Avoided overdesign of slug catcher

- Additionally, other issues could be study like accurate estimation of the HIPPS plant safety time, resulting in a better visualization of operating parameters.

➤ **Future Improvements**

- Less computational time to reduce the required man hours
